Coding Standards Cheatsheet

Masterschool

Based on Python's **PEP 8**

1. Code Styling

Indentation

- Use only 4 spaces, not tabs.
- Never mix tabs and spaces.

Don't

```
def total_sum(num1, num2):
  return sum1 + sum2
```

Do

```
def total_sum(num1, num2):
    return sum1 + sum2
```

Spacing

- No whitespace inside parentheses, brackets, braces.
- Single space after commas.
- Single space around operators.

Don't

```
result= total_sum( 1,4 )
results[ i ] = result*0.1
```

Do

```
result = total_sum(1, 4)
results[i] = result * 0.1
```

Line length

- Break down long lines using commas or operators

Don't

```
days = {"Monday": "Mon", "Tuesday": "Tues"…
```

Do

```
days = {
        "Monday": "Mon",
        "Tuesday": "Tues",
```

Other

- Add 2 blank lines between functions.

2. Naming

- Variables and functions should be in snake_case.
- Avoid single letters and reserved Python names.
- Choose meaningful names.

Don't

```
gd = 55
Students = ["Johnny", "Irina"]
list = CheckGrades(Students)
```

Do

```
grade_to_pass = 55
students = ["Johnny", "Irina"]
students_passed = check_grades(students)
```

3. Documentation

- Use block comments to structure your code.
- Use inline comments sparingly.
- If the code is not clear – rewrite the code, don't add comments.

Don't

```
sage_min = 18  # student minimal age

some_func()      # too
another_func()   # many
finish()         # comments
```

Do

```
minimal_student_age = 18

# Get all grades from database
some_func()
another_func()
finish()
```

- Write a docstring for every function.

Do

```
def add_bonus(grade):
    """This function gets a grade,
    adds 10% bonus points and returns
    the new grade as int.
    """
```

4. Constants

- Never use "magic numbers" in your code.
- Constants should be in CAPITALS under the imports.

Don't

```
import time

full_salary = hours * 20 - 150
```

Do

```
import time

HOUR_SALARY = 20
DEDUCTION_FOR_UNION = 150

full_salary = hours * HOUR_SALARY -
DEDUCTION_FOR_UNION
```
